

Deployment Process & Checklist

Applicable Roles: DEVELOPER, DEVOPS

Pre-Deployment Checklist

Before any deployment:

- All tests passing (unit, integration, e2e)
- Code review approved and merged
- Release branch created from main
- Database migration scripts ready and tested
- Rollback plan documented
- Stakeholders notified

Deployment Environments

- Development: Developer's local machine
- Staging: Mirrors production, used for UAT
- Production: Live environment

Deploy to staging first, validate, then deploy to production

CI/CD Pipeline

Automated pipeline steps:

1. Code push triggers build
2. Run linting and static analysis
3. Run unit/integration tests
4. Build Docker image
5. Push to container registry
6. Deploy to staging
7. Run smoke tests
8. Manual approval gate for production
9. Deploy to production (rolling update)

Post-Deployment

After deployment:

- Verify health endpoints
- Check error rates and latency
- Monitor for 30 minutes minimum
- Run smoke tests against production
- Notify team on Slack
- Tag release in git

Rollback Procedure

If issues detected:

1. Identify severity: P1 (critical) vs P2 (minor)
2. For P1: Immediately rollback to previous version
3. Execute rollback script
4. Verify rollback success
5. Post-incident review within 24 hours
